

Checkbox Functionality Code Quiz Spec

Planning

- When checkbox is checked, button should be disabled
 - Checkbox controls button via boolean state:
 - state determines value of `disabled` property on button
- I recommend calling state `disabled`, defaulting to `false`
- `onChange` for checkbox
 - `{(e) => setDisabled(e.target.checked)}`

Tests

- Clicking the checkbox
 - `fireEvent.click`
 - 2x in test: once to enable, once to disable
- Assertions to check button
 - `expect(button).toBeEnabled()`
 - `expect(button).toBeDisabled()`
